

AI Disclosure

1. I used AI a strong amount during this project. I first started using Claude to help set up an outline for me to follow so that I could finish the project in the said amount of time. I used it to set out time estimated requirements for each step. I then used it to create teacher walk-through sessions for creating the project. I truly had no experience with MCPs before and so I tried to start reading papers but having Claude summarize the steps to get started saved me time and useless reading for this project. Another large part that I used AI for was for my jupyter notebook. I had written code but had weak structure, therefore, I used AI to create headers, subtitles, and tables to describe my variables. Also, good docstrings and comments throughout my code were helpful. In the notebook I talk about certain instances that AI was helpful for creating certain sections that I had in mind to make but just didn't have all the time in the world to create.
2. A large part of the actual MCP integration I spent a lot of time on researching/working through and making the connection secured. Also when it came time to make the LSTM I drew from the previous homeworks in the class. I had to research about the different types of forecasting and stock variables that I should include in my model so that was a large part of the work that I focused on. Integrating my W&B account was a small step ofc but something that I worked on myself of course.
3. When I first started setting up the connection between Claude and my local drive and model it really struggled at understanding the connection specifically when it came to my files and certain libraries I needed to have. For instance, I had to end up deleting my Python download and re-installing it because it didn't line up with another newer package that I needed to use for my model. However overall, Claude was really great at creating simple plots and making infographics for my notebook which saved me a ton of time overall.
4. I think looking at the time spent vs. time I could've spent without AI is definitely something to consider. It helped me tremendously with the learning curve of this project. I had close to 0 knowledge prior on stock forecasting and also MCP integration. I think that no I wouldn't be able to talk about it forever in great detail, however I could feel confident having a conversation about it now. That I would say is the main drawback of using such a powerful tool.
